“Did you know that the average homeowner can save up to 20 percent on energy bills by planting the right trees in the right places? That tree can also improve air quality, sequester carbon, help manage stormwater runoff, and more.” .....excerpt from the **Arbor Day Foundation** website

## ABOUT TREES

Trees have many benefits that benefit life on planet earth. But first, what is a tree? A tree is a plant made of wood, that can live for many years. The oldest tree discovered was estimated to be 5,000 years old.

A tree is composed of the following components:

**Roots** - these are usually located underground. However, the exceptions to this are the roots of the mangrove tree which are often underwater, and the banyan tree that has aerial roots that provide support.

Trees have many roots, from which nutrients and water from the ground are carried through the trunk and branches to the leaves of the tree. Roots provide support for the tree parts above ground, holding them upright and keeping them from falling over. The roots of a tree serve to anchor it to the ground and gather water and nutrients to all parts of the tree. They are also used for reproduction, defense, survival, energy storage, and other purposes.

**Trunk** - this is the main body of the tree and is covered with bark to protect it from damage. The innermost layer of bark is known as the phloem and this transports the sap containing sugars made by photosynthesis to other parts of the tree. The trunk is a superhighway that conveys water and nutrients from the roots to the above-ground parts of the tree and distributes the food produced by the leaves to all other parts, including the roots.

**Branches** - these are the growth from the tree trunk. They start thick and get progressively smaller the farther they grow from the trunk. Branches themselves split into smaller branches until at the end they are quite small. The small ends are called twigs.

**Tree Leaves** - are green most of the time, but they can come in many colors, shapes, and sizes. The leaves take in sunlight and use water and food from the branches via the trunk and roots to make the tree grow and reproduce. The main functions of leaves are photosynthesis and gas exchange.

Leaves are often flat, so they can absorb more light, and thin so that the sunlight can get to green parts in the cells, which convert sunlight, and carbon dioxide from the atmosphere, and water from the roots into glucose and oxygen. Most of a tree's biomass comes from this process.

Trees with leaves all year round are evergreens, and those that shed their leaves are deciduous. Deciduous trees and shrubs generally lose their leaves in autumn as it gets cold. Before this happens, the leaves change color. Leaves grow back in the spring.

Note: trees and shrubs take in water, carbon dioxide, and give out oxygen with sunlight to form sugars. Plants also do some respiration using oxygen in the same way mammals do. They need oxygen as well as carbon dioxide to live.

To exist as a nation, to prosper as a state, and to live as a people, we must have trees.

- *Theodore Roosevelt*

## TREES FACTS

What trees do for us?

- Help clean our air.
- Provide us with oxygen.
- Clean our drinking water.
- Reduce the effects of climate change.
- Benefit wildlife.
- And much more.....

## FREE TREES

One of the easiest ways that you can beautify your property is to plant trees on it! Did you know that with your membership to The Arbor Day Foundation, a 501(c)(3) nonprofit conservation and education organization, you will receive:

- 10 FREE flowering trees that grow well in your area.
  - Tree discounts with your purchase of trees.
  - Selection includes shade, flowering, ornamental, fruit trees, evergreens, and more.
- A subscription to the Arbor Day newsletter.
  - A gardener's handbook and tree information guide.
- The Tree Book.
  - Provides Guides about planting and caring for trees.

*Note: landscaping is a great way to increase the value of your property and create great curb appeal.*
